

AI Race — Fun Features to Add

Additional gameplay features designed to make AI Race more social, competitive, surprising, and entertaining while preserving the core idea that players genuinely develop their own language models.

1. Try Other Players' AI

Players can interact with other players' AI models directly. They can chat with them and give them tasks to discover how they behave. Players cannot inspect, modify, or access the underlying model, training data, architecture, weights, or development process.

2. AI Battles

Players can put their AI into competitive challenges against other players' models. Battles can test reasoning, creativity, writing, coding, problem solving, conversation, or other capabilities. Different models can have different strengths, so there does not need to be one universal definition of the best AI.

3. AI Trading & Licensing

Players can trade, sell, or license access to their AI models or selected capabilities. A company may choose to use another player's AI instead of developing the same capability itself, creating an AI economy between players.

4. AI Discoveries

During development and experimentation, players can discover unexpected strengths, weaknesses, or behaviors in their AI. These discoveries should emerge naturally from training data, experiments, and development decisions rather than being a fixed list of abilities to unlock.

5. Naturally Emerging AI Personality

Personality should not be a forced mechanic or a personality-selection menu. The game should simply allow distinctive behavioral characteristics to emerge naturally from the model, its training, development decisions, and continued interaction. Some AIs may develop a recognizable personality while others may remain relatively neutral.

6. AI Interviews

Players can conduct interviews with their own AI or other players' public AI models. Interviews can reveal interesting behavior, expose unexpected strengths or weaknesses, create memorable moments, and potentially generate publicity and reputation for the company.

Core Design Rule

You can interact with another player's AI, but you cannot look inside it.

Players discover what another AI can do through interaction, battles, interviews, and real-world use, without gaining access to the underlying development process. This preserves the feeling that every player has genuinely created something of their own.

Overall Goal

These features should make AI Race feel like a living ecosystem of player-created AIs. Players should want to discover interesting models, test them, compete with them, cooperate with their creators, trade with them, and eventually become known for the AI they built.
